

Questions parents should ask of the NIH, CDC, FDA and IOM From Ray Gallup

1. Why doesn't the NIH replicate the clinical science studies that Dr. Vijendra Singh and Dr. Andrew Wakefield have done and take it to the next level?

2. Why isn't there scientific curiosity as to why children with autism have elevated measles antibody titers, measles in the gut and measles in the spinal fluid. Isn't there an interest to explain this especially when the CDC, NIH, and IOM say that the autism epidemic is a mystery but then deny a link between the MMR vaccine and autism.

3. Why is there a conflict of interest between pharmaceutical companies and the CDC and FDA as per this article.....<http://www.upi.com/view.cfm?StoryID=20030718-012134-4422r>

Aren't these government health agencies responsible to the American public rather than serve their masters at the pharmaceutical companies?

4. Why hasn't the FDA conducted any independent, long-term safety studies on vaccines? If as in number 3 they can't do this then what public agency can do it?

5. Why hasn't the NIH conducted any immunology studies regarding autism since it is well known that autism involves an autoimmune component?

6. Why are all studies done by the IOM, CDC and NIH denying links between vaccines and autism just epidemiology studies and none of the studies involve clinical science such as immune blood panel tests, colon biopsies, etc.

7. Why is mercury in fish and broken thermometers dangerous while mercury in vaccines is not according to the IOM and CDC?

8. Why aren't there more questions about what is put in vaccines when the product package inserts says it all as per.....<http://www.whale.to/vaccines/ingredients1.html>

9. Why the denial of a vaccine link to autism when clearly there has been no clinical science to disprove the link. There has been no clinical science to explain why children with autism have elevated measles antibodies in their blood, measles in the gut and measles in the spinal fluid.

10. Why does the FDA keep a file called VAERS (Vaccine Adverse Event Reaction System) that documents adverse reactions to vaccines and nothing is done with it.

11. Shouldn't the NIH and CDC be interested in looking into stopping the epidemic of autism and see if they can develop immunology treatment strategies to help those children and their families who are victims.

12. Why do the NIH, CDC, IOM and FDA get money if they aren't concerned about the autism epidemic and they want to continue to look the other way. Why are they funded by the general public and not the pharmaceutical companies who they represent more effectively. What benefit do these agencies give the American public.
